## Abstract

The ovipositor of apocritan Hymenoptera is an invaluable source of phylogenetically relevant characters, and our understanding of its functional morphology stands to enlighten us about parasitoid life history strategies. Although Ceraphronoidea is one of the most commonly collected Hymenoptera taxa with considerable economic importance, our knowledge about their natural history and phylogenetic relationships, both to other apocritan lineages and within the superfamily itself, is limited. As a first step towards revealing ceraphronoid natural diversity we describe the skeleтомuscular system of the ceraphronoid ovipositor for the first time. Dissections and Confocal Laser Scanning Microscopy 3D media files were used to visualize the ovipositor complex and to develop character concepts. Morphological structures were described in natural language and then translated into a character-character state format, whose terminology was linked to phenotype-relevant ontologies. Four unique anatomical phenotypes were revealed: 1. The first valvifer (gonangulum) of the genus *Trassedia* is composed of two articulating sclerites, a condition present only in a few basal insect taxa. The bipartition of the first valvifer in *Trassedia* is most likely secondary and might allow more rapid oviposition. 2. Ceraphronoids, unlike other Hymenoptera, lack the retractor muscle of the terebra; instead the egg laying device is retracted by the seventh sternite. 3. Also unlike other Hymenoptera, the cordate apodeme and the anterior flange of the second valvifer are fused and compose one ridge that serves as the site of attachment for the dorsal and ventral T9-second valvifer muscles. Overall, the ceraphronoid ovipositor system is highly variable and can be described by discrete, distinguishable character states. However, these differences, despite their discrete nature, do not reflect the present classification of the superfamily and might represent parallelisms driven by host biology.

## Keywords

Skeletomusculature, second valvula, ovipositor sheath, *Aphanogmus*, *Ceraphron*, *Conostigmus*, *Megaspilus*, *Dendrocerus*, *Lagynodes*, Hymenoptera Anatomy Ontology, Phenotypic Quality Ontology, Spatial Ontology

## Introduction

Ceraphronoidea has, until recently, been one of the most neglected groups of parasitic Hymenoptera, despite their ubiquity in the environment and fascinating life history strategies, which span from primary to quaternary parasitism (hyper-hyper-hyperparasitism) (Haviland 1920). Since the establishment of Ceraphronoidea as a superfamily (Masner 1956, Masner and Dessart 1967) significant revisionary work has addressed Lagynodinae (Dessart 1977, 1987), species of *Conostigmus* Dahlbom (Dessart 1997) and species groups of *Dendrocerus* Ratzeburg (Dessart 1972, Fergusson 1980, Dessart 1985, Dessart 1995a, Dessart 1999, Dessart 2001). Records of parasitism by ceraphronoids cover a wide range of hosts, from at least eight insect orders: Hemiptera, Thysanoptera, Hymenoptera, Neuroptera, Coleoptera, Trichoptera, Diptera and Mecoptera (Austin 1984, Chiu et al. 1981, Cooper and Dessart 1975, Dessart 1967, 1992, Dessart and Bournier 1971, Evans et al. 2005, Fergusson 1980, Ghesquiere 1960, Ishii 1937, Luhman et al. 1999, Muesebeck 1979, Priesner 1936, Sinacori et al. 1992). Two species, *Dendrocerus carpenteri* (Curtis), and *Dendrocerus aphidum* (Rondani), serve as models for research concerning resource use and allocation by parasitoids (Araj et al. 2006), mate location (Schwörer et al. 1999), development and host interactions (Marris et al. 2000), sex determination of offspring (Chow and Mackauer 1996), host discrimination (Chow and Mackauer 1999), and behavioral evolution in bio-control systems (Müller et al. 1997).

The phylogenetic placement of Ceraphronoidea remains uncertain despite the recent efforts to resolve the Hymenoptera tree of life (Heraty et al. 2011, Sharkey et al. 2011). Using expressed sequence tag (EST) data and limited exemplars, Sharanowski et al. (2010) placed Ceraphronoidea as sister to Evanioidea, but with low support. Heraty et al. (2011), using data from four genetic loci, placed Ceraphronoidea as sister to Stephanidae or Stephanidae + Orussidae, depending on the analysis. Vilhelmsen et al. (2010) found Ceraphronoidea to be sister to Megalyroidea within Evaniomorpha, based on morphological data. Sharkey et al. (2011) using molecular data and morphological data - based largely on Vilhelmsen et al. (2010) - also suggested a sister relationship between Ceraphronoidea and Megalyroidea.

The most comprehensive review on the classification of the superfamily has proposed by Dessart and Cancemi (1987). Although this classification served as a template for further studies (Masner 1993, Dessart 1995a, b, Mikó and Deans 2009) the phylogenetic base has never been challenged. The utility of traditionally used morphological characters in Ceraphronoidea classification seems to be limited (Dessart 1995b,

c, 2001) and with the discovery of the first ceraphronid wasp with well-developed pterostigma even the family level classification of the superfamily has been challenged recently (Mikó and Deans 2009). Our recent observations on the genus *Trassedia* provide additional evidence that the current classification of the superfamily needs to be revised (Mikó et al. in press). The genus was erected by Cancemi (1996), who classified the type species within Megaspilinae and considered it to be closely related to *Conostigmus*. The original classification is supported by two distinct character states: the presence of a fore wing pterostigma (which has subsequently been found in Ceraphronidae; Mikó and Deans 2009) and the presence of 11 antennomeres (Ceraphronidae have 10). Our observations of multiple specimens of *Trassedia luapi* reveal numerous morphological character states that are specific to Ceraphronidae (Mikó and Deans 2009, Mikó et al. in press): absence of mesotibial apical spur, absence of narrow sclerite anterior to synsternum, presence of Waterston's evaporatorium, and numerous male genitalia characters. Based on these differences the genus has recently been transferred to Ceraphronidae (Mikó et al. in press), a classification we follow in this study.

It is evident that a comprehensive study using both morphological and molecular characters is necessary for the reevaluation of Ceraphronoidea systematics. Since traditionally used morphological characters have been phylogenetically inconsistent the utilization of unexplored character systems, such as the male and female terminalia might offer additional data relevant to more robustly estimate the phylogenetic history of this group.

Despite the extensive descriptive work done on comparative morphology of the Hymenoptera female terminalia (Oeser 1961, Smith 1970, Le Ralec et al. 1996, Quicke et al. 1992, Quicke et al. 1994, Quicke et al. 1999, Vilhelmsen 2000, Vilhelmsen et al. 2001), the available morphological data on the ceraphronoid female terminalia are restricted to the distal region of the terebra (Quicke et al. 1994, Le Ralec et al. 1996) and the accessory glands (Höller et al. 1993). The skeleтомuscular system of ceraphronoid ovipositor remained, until now, relatively unexplored. The main aim of the present study is to describe morphological diversity of the female terminalia in Ceraphronoidea and compare its anatomical structures with that of other Hymenoptera taxa giving special emphasize on the skeletomuscular system. With this study, we establish a baseline for further phylogenetic analyses of the superfamily using ovipositor characters.

## Materials and methods

Specimens used in this study (Table 1) were identified by Andrew Ernst (AFE) and István Mikó (IM). Megaspilinae was represented in our study by *Megaspilus armatus* (Say), *Dendrocerus spissicornis* (Hellén) and *Conostigmus abdominalis* (Boheman); Lagynodinae (Megaspilidae) by *Lagynodes* sp. (AFE); and Ceraphronidae by *Ceraphron* sp. (IM) (Fig. 5), *Aphanogmus* sp. 1 (AFE), *Aphanogmus* sp. 2 (IM) and *Trassedia luapi* (Cancemi).

**Table 1.** Specimens observed for morphological description including specimen identifiers, preparation techniques, imaging method and collecting locality (verbatim collecting data are stored at figshare.com.).

Specimens used in the present study were stored in 95% ethanol. Some specimens were critical point dried and dissected on Blue-Tack (Blue Tack, Bostik inc.) medium. This method is mostly used to reveal the spatial relationships between muscles. Other specimens were dissected in glycerin on a concave microscope slide or were macerated in KOH to visualize the skeletal structures. Dissections and observations were made using an Olympus SZX16 stereomicroscope and an Olympus CX41 compound microscope.

Bright field images were taken using an Olympus CX41 compound microscope, equipped with an Olympus DP71 digital camera. Image stacks were combined using CombineZP (Hadley 2010) “do stack” command. SEM micrographs were made using a Hitachi S-3200 Scanning Electron Microscope (wd=23.5, av=5kV). Specimens were critical point dried and coated with palladium prior to examination. CLSM images were made on glycerin-stored specimens between 1.5 mm thick, 24×50 mm cover glasses with a Leica LSM 710 and Olympus Fluoview 1000 confocal laser scanning microscopes (CLSM) using the 488 nm laser to excite the sample. We collected the autofluorescence of insect anatomical structures between 500 and 700 nm with two channels (500–580; pseudocolor green and 580–700 pseudocolor red) using 106 and 206 Plan Achromat objectives. Volume rendered images and media files were generated by Imaris Bitplane (Bitplane, Zürich, Switzerland) and ImageJ (Schneider et al. 2012) software. Bright field and CLSM micrographs were edited with Adobe Photoshop CS4 (Adobe) changing “Gamma Correction” value, resize images to 7.3 cm width at 400 dpi resolution, standardize style and width of scale bars and create image annotations. Media files, SEM micrographs and bright field images are available from figshare.com (Table 1).

To verify the relationships between anatomical structures, serial transverse sectioning was carried out on a *Lagynodes* specimen (Table 1). The specimen was embedded in Araldit®, cut at 1 µm with a Microm microtome (HM 360), and stained with toluidine blue.

Anatomical terms used in the descriptions are linked to concepts in the Hymenoptera Anatomy Ontology (HAO; Hymenoptera Anatomy Portal (<http://portal.hymao.org>), Yoder et al. 2010), the Phenotypic Quality Ontology 1.2 (PATO; Gkoutos et al. 2004) and the Biospatial Ontology (Mungall 2013) via a table of uniform resource identifiers (URIs) (Appendix) following Seltmann et al. 2012.

## Towards semantic statements

Verbatim descriptions composed in natural language serve as the traditional way for communicating observations in insect morphology. However, these descriptions can be decoded only by morphology experts, are hardly accessible to non-expert researchers and cannot be reasoned over efficiently by text-mining applications (Vogt et al. 2010, Deans et al. 2012a, b, Vogt et al. 2013). Morphological descriptions, albeit they are arguably more complex, shares numerous similarities with taxonomic descriptions which

were the objects of recent efforts for altering the way of biodiversity descriptions into a more accessible format. Deans et al. (2012a) proposed a new description model for taxonomists applying semantic statements. These statements are written in a logic and queryable format and are linked to the concepts of biomedical ontologies. Semantic descriptions are therefore not only transparent for researchers unfamiliar with specific morphological jargon, but can be executed via an automated reasoning mechanism (Balhoff et al. in press, Mullins et al. 2012).

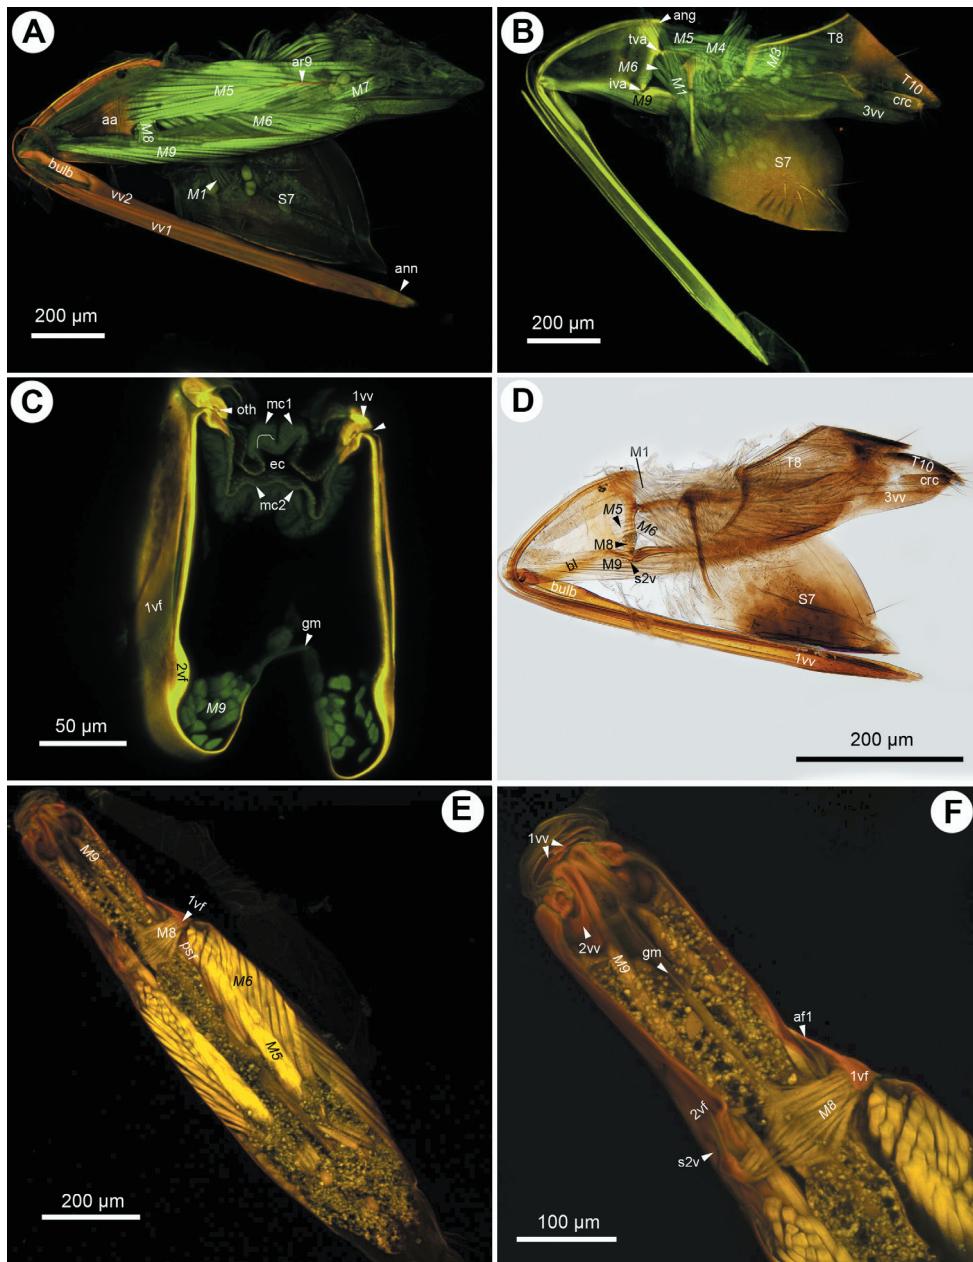

To meet the grand challenge of describing phenotypes in a semantic way, using Web Ontology Language (OWL; <http://www.w3.org/TR/owl-features/>) for example, one must be familiar with tools of the Semantic Web (e.g., Protégé, <http://protege.stanford.edu/> and Manchester Syntax, <http://www.w3.org/TR/owl2-manchester-syntax/>). Perhaps more importantly, one also has to provide a character/character state description with terms explicitly linked to ontologies.

We provide here an example of the transformation of our natural language descriptions to character/character state format and to link the terminology to relevant phenotype ontologies. Our goal is to make this product more accessible to future reasoning applications. During the “ontologization” procedure the describer is forced to provide strict, structure-based definitions for each anatomical concept, which itself enhances the readability, objectivity, consistency and comparability of the research product.

## Results I: Natural language descriptions of anatomical structures in the ceraphronoid ovipositor assembly and S7

### Integument

The first valvifer is dorsoventrally elongated in lateral view (ch1: 0; **1vf**: Figs 2E, 5A, E, 6A, D) with convex anterior (ch2:0) and straight (ch3:0; **p1v**: Figs 2D, 4A, 6A) or concave posterior margins (ch3:1; **p1v**: Fig. 3D) in all taxa except *Dendrocerus* where the posterior margin of the first valvifer is angled at the tergo-valviferal articulation (ch3:2; **p1v**: Fig. 4F). The first valvifer is not subdivided (ch4:1; **1vf**: Figs 2E, 5A, E, 6A, D) except in *Trassedia*, where the transvalvifer conjunctiva (ch4:0; **tvc**: Fig. 3E) separates the elongate dorsal sclerite (ch5:0; **d1vf**: Fig. 3E) from the triangular ventral sclerite of the first valvifer (ch6:0; **v1vf**: Fig. 3E). The sclerites articulate with one another at the intravalvifer articulation (ch7:0; **iava**: Figs 3C, E), which is located anteriorly on the border between the two sclerites (ch8:0). The ventral margin of the dorsal sclerite (ch9:0) and the anterodorsal margin of the ventral sclerite are thickened relative to surrounding regions (ch10:0). The anterior flange of the first valvifer (**af1**: Fig. 1F) overlapping the second valvifer is present (ch11:0) in *Conostigmus*, *Dendrocerus* and *Megaspilus*, and *Lagynodes* but absent from Ceraphronidae (ch11:1). The first valvifer articulates with the second valvifer on its posteroventral corner (ch12:0; intervalvifer articulation, **iva**: Figs 1B, 2C, 3A–C, E, 4A, F, 5A, B, E, 6A, C, D) and with T9 on its posterior margin (ch13:0; tergo-valvifer articulation, **tva**: Figs 1B, 2C, 3B, C, E, 4A,

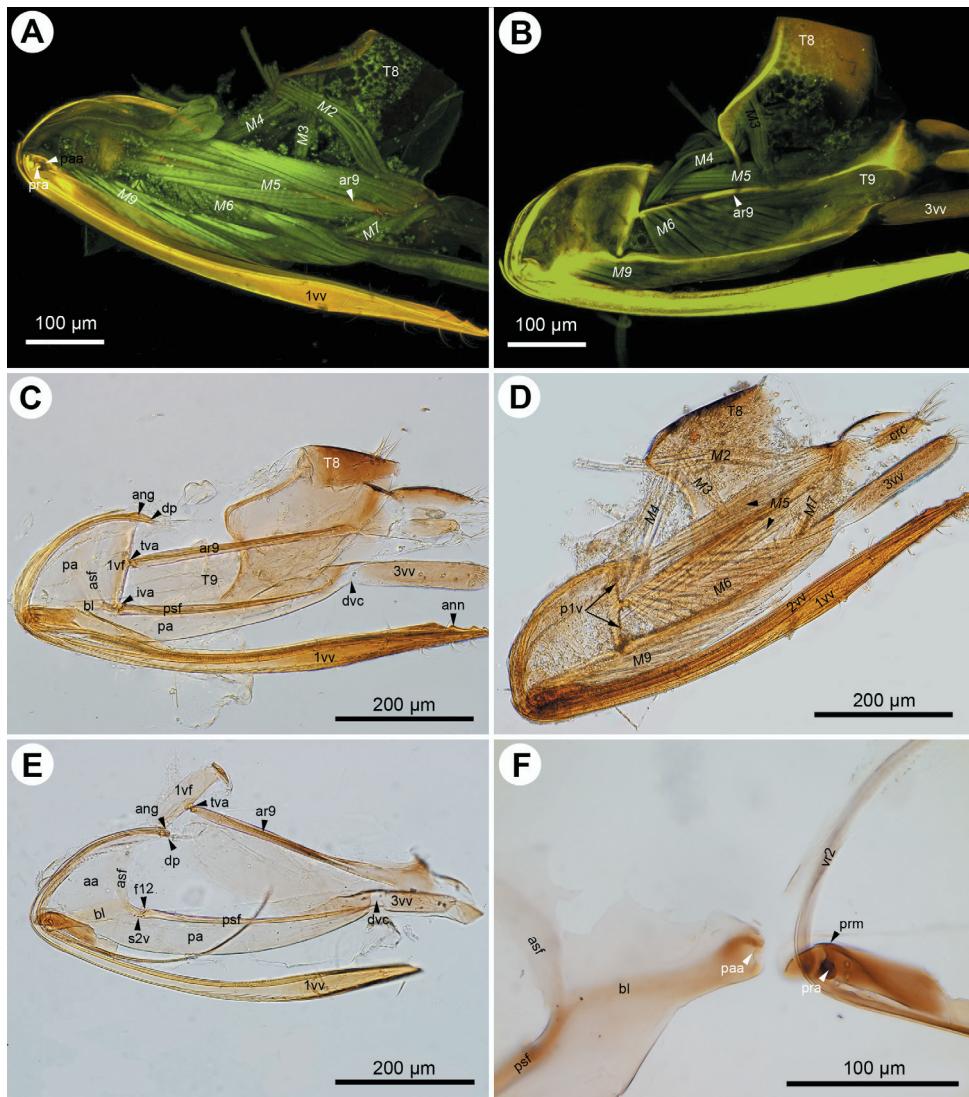

**Figure 1.** CLSM micrographs and bright field image showing the female terminalia of *Megaspis armatus* (Say). **A** CLSM, medial view (doi: 10.6084/m9.figshare.156434) **B** CLSM, lateral view (doi: 10.6084/m9.figshare.156442) **C** CLSM, transverse section, white line indicates site of separation of median conjunctivae of the first valvulae (doi: 10.6084/m9.figshare.156437) **D** bright field, lateral view **E-F** CLSM, frontal section, dorsal view (doi: 10.6084/m9.figshare.156458; doi: 10.6084/m9.figshare.156457, doi: 10.6084/m9.figshare.156456, doi: 10.6084/m9.figshare.156455). All anterior to the left.

F, 5A, B, E, 6A, C, D). The tergo-valvifer articulation is in the middle of the posterior margin of the first valvifer in *Conostigmus* and *Lagynodes* (ch14:0; **tva**: Figs 2C, 4A), it is on the ventral half of the margin (ch14:1; **tva**: Figs 3B, C, E, 5A, B, E, 6D) in *Ceraphron*, *Aphanogmus* sp. 2 and *Trassedia*, where it is located ventrally on the posterior margin of the dorsal sclerite of the first valvifer (ch15:0; **tva**: Fig. 3B, C, E), it is in the upper half of the margin in *Megaspilus* and *Dendrocerus* (ch14:2; **tva**: Figs 1B, 4F) and adjacent to the anterior angle in *Aphanogmus* sp. 1 (ch14:3; **tva**: Figs 6A, C).

The anterior area of the second valvifer is expanded dorsally into a broad, flat, laterally directed surface (ch16:0; **aa**: Figs 1A, 2E). The basal line of the second valvifer (ch17:0) is a sharply defined ridge in *Ceraphron*, *Trassedia*, and *Aphanogmus* sp. 2 (ch18:0; **bl**: Figs 3B–D, 5A, E, 6D) but a thickening with diffuse margins in *Aphanogmus* sp. 1 and *Megaspilidae* (ch18:1; **bl**: Figs 1D, 2C, E, 4A, F). The dorsal projection of the second valvifer (ch19:0) is longer than the length of the anterior area of the second valvifer in *Ceraphron* and *Trassedia*, and *Aphanogmus* sp. 2 (ch20:1; **dp**: Figs 3C, E) whereas the projection is shorter than the length of the anterior area in other taxa examined (ch20:2; **dp**: Figs 2E, 4A). The anterior section of the dorsal flange of the second valvifer is sharply defined ridge in *Ceraphron*, *Aphanogmus* sp. 2, and *Trassedia* (ch21:0; **ASF**: Figs 3B, C, D, 5A–E, 6D) but a thickening with diffuse margins in *Megaspilidae* and *Aphanogmus* sp. 1 (ch21:1; **ASF**: Figs 2C, E, F, 4A, F). The posterior section of the dorsal flange of the second valvifer is sharply defined (ch22:0; **psf**: Figs 2C, E, 4A, D, 5A, E). The area of the second valvifer posterior to the intervalvioe articulation is elongate (ch23:0 **pa**: Figs 2C, E). The ventral margin of the second valvifer curves mediadorsally (ch24:0) encircling the posterior second valvifer-second valvula muscle (ch25:0. **2vf**, **M9**: Fig. 1C). The genital membrane of the second valvifers accommodates the terebra when it is retracted (ch26:0; **gm**: Fig. 1C). The venom gland reservoir is surrounded by the second valvifer is present in *Ceraphronidae* and *Lagynodes* (ch27:0; **res**: Figs 3A–E). The reservoir was not observed in other *Megaspilidae* (ch27:1). The content of the reservoir is yellowish, transparent and hard, resin-like (ch28:0; **res**: Fig. 5F) in critical point dried specimens.

The first valvula tapers distally in lateral view in *Ceraphron*, *Aphanogmus* sp. 2 and *Trassedia* (ch29:0; **1vv**: Figs 3B, 5A, F, 6D), whereas it is spatulate in *Megaspilidae* and *Aphanogmus* sp. 1 (ch29:1; **1vv**: Figs 1A, D, 2A, C, D, E, 4A, B, 6B, C). The banding pattern and annuli are missing from the first valvula (ch30:0; ch31:0).

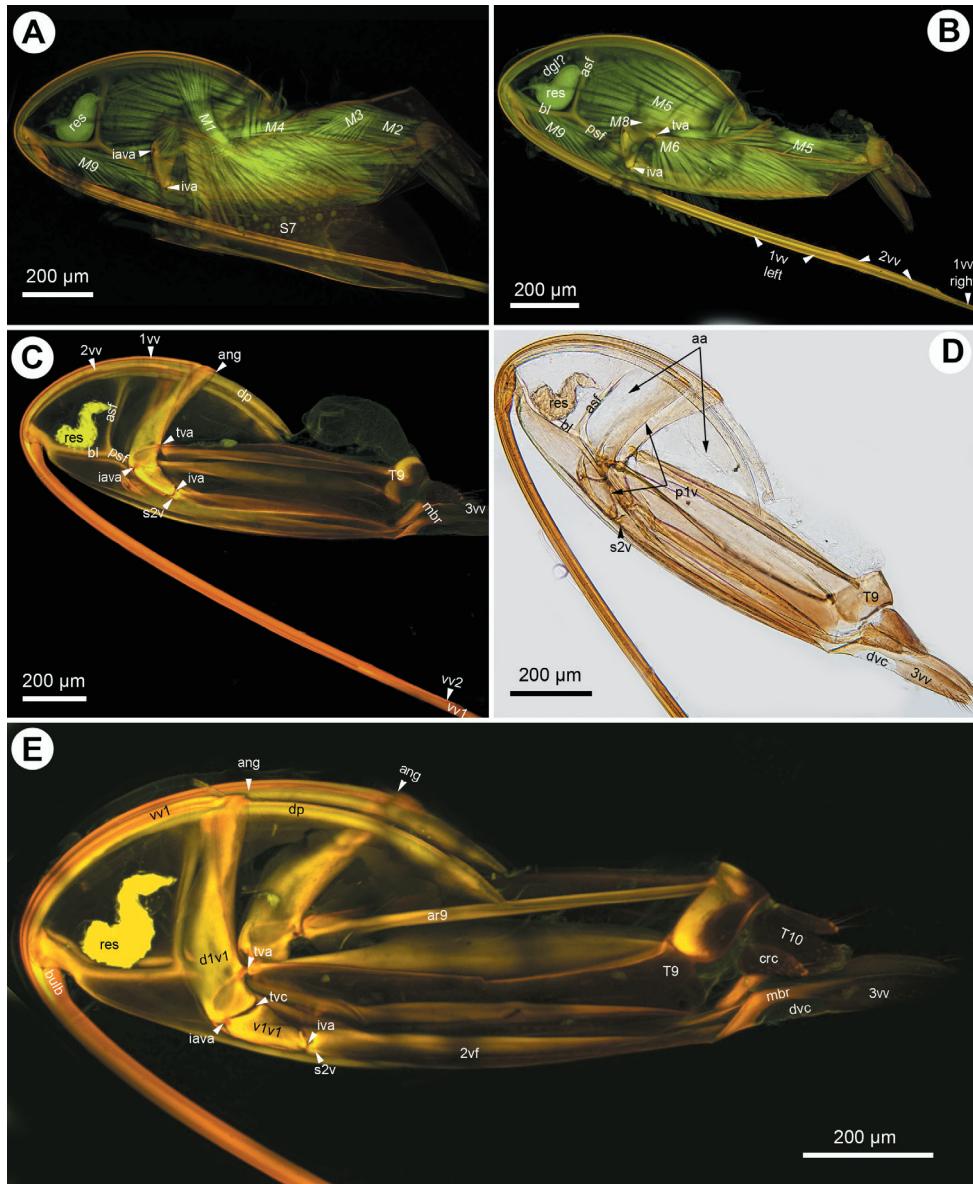

The second valvulae are expanded proximally into the bulb (ch37:0; **bulb**: Figs 1A, D) and fused distal to the bulb (ch35:0). The dorsal valve tapers distally in dorsal view (ch36:0) and the anterior margin of the bulb is curved dorsally. The processus articulatis is located laterally (ch32:0; **pra**: Figs 2F, 5D), the anterior notch of the dorsal valve anteriorly (ch33:0) and the processus muscularis anterodorsally on the bulb (ch34:0; **pm**: Fig. 2F). The anterior area of the second valvifer is 2.0 times as high as the bulb in lateral view in *Dendrocerus* and *Aphanogmus* sp. 1 (ch38:0; Figs 4E, 6B) whereas it is more than 2.0 times as high as the bulb in *Ceraphron* and *Megaspilidae* (ch39:1). Banding pattern is absent (ch39:0) whereas annuli are present on the dorsal valve in *Megaspilidae* (ch40:0; **ann**: Figs 1A, 2C) but absent in *Ceraphronidae* (ch40:1). The

**Figure 2.** CLSM micrographs and bright field image showing the female terminalia of *Conostigmus abdominalis* (Boheman). **A** CLSM, medial view (doi: 10.6084/m9.figshare.156448) **B** CLSM, lateral view (doi: 10.6084/m9.figshare.156433) **C** bright field, medial view, muscles removed **D** bright field, medial view **E** bright field, medial view, first valvifer and T9 separated from second valvifer, muscles removed; **F**, bright field, second valvifer removed from second valvulae, muscles removed. (ch45:0; **3vv**: Figs 1B, 2B–E, 3C–E, 4D, F, 5E, F, 6A, B, F), its lateral wall is convex (ch46:0) and sclerotized (ch47:0) whereas its medial wall is concave (ch48:0; **3vv**: Fig. 3E) and membranous (ch49: 0; **3vv**: Fig. 3F).

**Figure 4.** CLSM micrographs and bright field image showing the female terminalia of Megaspilidae. A–C: *Lagynodes* sp.: **A** CLSM, lateral view (doi: 10.6084/m9.figshare.156443) **B** CLSM, medial view (doi: 10.6084/m9.figshare.156454) **C** bright field, medial view. **D–F** *Dendrocerus spissicornis* (Hellén), CLSM: **D** ventral view (doi: 10.6084/m9.figshare.156451, doi: 10.6084/m9.figshare.156449) **E** medial view (doi: 10.6084/m9.figshare.156452) **F** lateral view (doi: 10.6084/m9.figshare.156459, doi: 10.6084/m9.figshare.156450). All anterior to left.

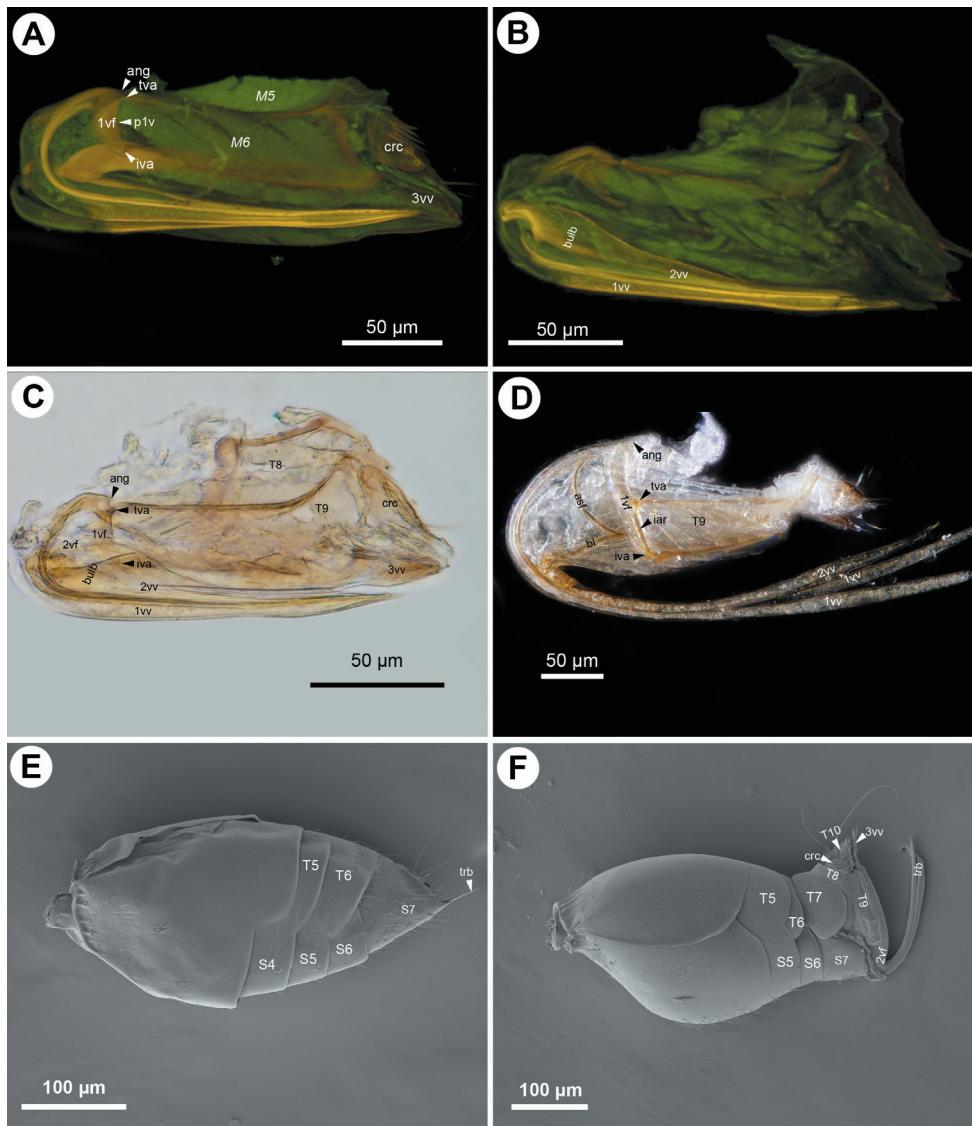

T9 is quadrangular in lateral view (ch50:0; T9: Figs 2B, C) and wider than long dorsomedially (ch51:0; T9: Figs 3D, E). The cordate apodeme and the anterior flange are continuous, composing the anterior ridge of T9 (ch52:0; **ar9**: Figs 2A–C, 3E, 4B), which is adjacent anteriorly with and separated posteriorly from the anterior margin of T9 (ch53:0.); the distance between the anterior margin of T9 and the ridge increases gradually posteriorly (ch54:0).

### Muscles (numbered according to Vilhelmsen 2000)

S7-first valvula muscle (**M1**: Figs 1B, D, 3A) arises anteriorly from S7 (ch55:0) and inserts on the first valvula at the dorsal margin of the ovipositor adjacent to the border of the first valvula and the dorsal end of the first valvifer (ch56:0). The muscle is oriented posterodorsally (ch57:0). The dorsal T8-T9 muscle (**M2**: Figs 2A, 3A, 4A, B) arises from along the anterior margin of T8 (ch58:0) and inserts dorsally on the anterior margin of T9 (ch59:0). The lateral T8-T9 muscle (**M3**: Figs 1B, 2A, B, D,

**Figure 6.** CLSM micrographs and bright field image showing the female terminalia of Ceraphronidae. **A-C:** *Aphanogmus* sp. 1: **A** CLSM, lateral view (doi: 10.6084/m9.figshare.156439) **B** CLSM, medial view (doi: 10.6084/m9.figshare.156446) **C** bright field, lateral view **D** *Aphanogmus* sp. 2, bright field, lateral view **E** *Synarsis* sp., SEM, lateral view **F** *Cyoceraphron* sp., SEM, lateral view. All anterior to left.

3A, 4A, 5A) arises from T8 posterodorsally of the dorsal T8-T9 muscle (ch60:0), and inserts on the anterior ridge of T9 (ch61:0). The T8-first valvifer muscle (**M4**: Figs 1B, 2A, 2B, 3A, 5A) arises from T8 dorsally of the site of attachment of the lateral T8-T9 muscle (ch62:0) and inserts on the first valvifer adjacent to the ninth tergal condyle of the first valvifer (ch63:0). The muscle inserts on the ventral sclerite of the first valvifer adjacent to the intravalvifer articulation (ch64:0; **M4**: Fig. 3A)

in *Trassedia*. The dorsal T9-second valvifer muscle (**M5**: Figs 1A, B, D, E, 2A, B, D, 3B, 4A, B, D, E, F, 5A–C, 6A) arises dorsally and ventrally from the anterior ridge of T9 with sites of origins extending ventrally and dorsally on the wall of the tergite (ch65:0) and inserts along the posterior margin of the anterior area of the second valvifer (ch66:0). The ventral T9-second valvifer muscle (**M6**: Figs 1A, B, D, E, 2A, B, D, 3B, 4A, B, D, F, 5A, B, 6A) is not subdivided (ch67:0) and arises from the medial side of the posterior area of the second valvifer (ch68:0). The site of insertion of the muscle extends along the anterior part of the anterior ridge of T9 in most taxa examined (ch69:0) except *Megaspilus*, and *Dendrocerus* where the muscle seemingly inserts partly on the interarticular ridge of the first valvifer (ch70:0; **M6**: Figs 1B, D, 4F). The posterior T9-second valvifer muscle (**M7**: Figs 1A, 2A, D, 4E) arises from the strap-like dorsal area of T9 (ch71:0) and inserts on the median bridge (ch72:0). The fan shaped first valvifer-genital membrane muscle (ch73:0; **M8**: Figs 1A, D, E, F, 3B, 5A, D) arises from the medial surface of the first valvifer near the intervalvifer articulation (ch74:0.). The site of insertion of the muscle extends along the genital membrane (ch75:0). In *Trassedia* the muscle arises from the medial surface of the dorsal sclerite of the first valvifer (ch76:1; **M8**: Fig. 3B). The posterior second valvifer-second valvula muscle (**M9**: Figs 1A–F, 2A, B, D, 3A, B, 4B, D–F, 5A, C, D) arises from the medial side of the posterior area of the second valvifer (ch77:0), and inserts on the processus musculares (ch78:0). In *Ceraphron* and *Trassedia* some bands of the muscle arise from the anterior area of the second valvifer (ch.77:1; **M9**: Figs 3A, B, 5A, C, D). T9-genital membrane muscle (ch79:0), lateral T9-second valvifer muscle (ch80:0), second valvifer-genital membrane muscle (ch81:0) and the anterior second valvifer-second valvula muscles (ch82:0) are absent from Ceraphronoidea.

## Results II: Semantically enhanced characters and character states for ceraphronoid female terminalia.

## Discussion

The enormous diversity of ovipositor phenotype in Hymenoptera reflects the manner in which the female wasp finds feasible environments for her developing larvae. Host structure and location, as well as the different ways of storing the ovipositor, are arguably the principal factors driving the structural adaptation of these structures (Quicke et al. 1999, Vilhelmsen 2000, Vilhelmsen and Turrissi 2011). Major morphological characteristics of ceraphronoid ovipositors are most likely related to these influences.

## Storage of terebra

The ceraphronoid ovipositor is stored in a horizontal position inside the metasoma, with its ventral part concealed by S7 (Fig. 6E). As the first oviposition movement, the contracting muscles between the apical metasomal tergites and sternites expose the ventral part of the ovipositor by rotating it and the ninth abdominal tergite posteriorly, from the resting, horizontal to the active, vertical position. This movement is common within Apocrita (Fig. 6F; Alam 1953, Copland 1976, Fergusson 1988).

The mechanism of the extension of the terebra from the second valvifer-third valvula complex is shared between Ceraphronoidea and most other Hymenoptera. The movement is facilitated by the posterior second valvifer-second valvula muscles (M9: Figs 1A–F, 2A, B, D, 3A, B, 4B, D–F, 5A, C, D; Vilhelmsen 2000). When the muscles contract they cause the bulb to pivot anteriorly at the basal articulation that is composed of the processus articularis and pars articularis (pra, paa: Figs 2A, 2F). As the bulb pivots, the distal end of the terebra move into an extended active position -

compare Fig. 1B (partially extended) with Fig. 2B (retracted). The terebra is held in the longitudinal axis during oviposition: <https://scholarsphere.psu.edu/files/r494vk42v>

At the end of the oviposition the terebra is retracted prior to the anterior rotation of the ovipositor/T9 complex into the resting, horizontal position. The retraction of the terebra, unlike its extension, seems to be unique for Ceraphronoidea. In other Hymenoptera the movement is accomplished by the contraction of the vertically oriented anterior second valvifer-second valvula muscle that arises from the anterodorsal margin of the second valvifer and inserts on the distal region of the bulb (King and Copland 1969, 1976, Vilhelmsen 2000, Fergusson 1988, Alam 1953). However, this muscle is absent from Ceraphronoidea, and thus we hypothesize a different mechanism for retracting the terebra. We observed a relatively large muscle arising from S7 and inserting dorsally on the first valvula in Ceraphronoidea (M1: Figs 1B, D, 3A). The position of the site of attachments of the muscle suggest that the S7-first valvula muscle (Figs 1B, 3A) aids in the retraction of the terebra. The presence of muscles arising from S7 and inserting on the first valvula has been reported only in some basal Hymenoptera (Dhillon 1966, Vilhelmsen 2000) and in one braconid species, *Stenobracon deesae* (Alam 1953). The S7-first valvulae muscle has an entirely different configuration in basal Hymenoptera. It arises from along the anterior margin of S7 and inserts on the proximal end of the ventral ramus of the first valvula and presumably contributes to the movement of the first valvula aiding the ventral T9-second valvifer muscle (Vilhelmsen 2000). In *Stenobracon*, however, the S7-first valvulae muscle has a very similar structure to that we reported in Ceraphronoidea (Alam 1953) suggesting the possible involvement of this muscle into the retraction of the terebra. Alam (1953) hypothesized that the muscle is involved in the movement of the median conjunctivae of the first valvulae (dorsal wall of the egg canal) influencing the egg movement along the egg canal. Although the anterior second valvifer-second valvulae muscle is present in all non-ceraphronoid Hymenoptera, it is possible that the S7-first valvulae muscle is involved in the retraction of the terebra in other Apocrita, and that this function is not an evolutionary novelty for Ceraphronoidea.

### Egg laying mechanism

The paired first and second valvifers and T9, operated together by the dorsal and ventral T9-second valvifer muscles, form the ovipositor machinery that is responsible for “drilling” the terebra into a substrate and moving the egg along the egg canal (Vilhelmsen 2000).

As the dorsal T9-second valvifer muscle (M5: Figs 1A, B, D, E, 2A, B, D, 3B, 4A, B, D, E, F, 5A–C, 6A) contracts the first valvifer pivots posteriorly (in anterior to the left position) at the intervalvifer articulation while contraction of the antagonistic ventral T9-second valvifer muscle (M6: Figs 1A, B, D, E, 2A, B, D, 3B, 4A, B, D, F, 5A, B, 6A) pulls the first valvifer in the opposite direction (compare the position of the tergo-valvifer (tva) and intervalvifer articulations (iva) on Figures 3A and 3E). As this

movement is what slides the first valvula along the second valvulae, the distance the first valvifer moves determines the distance the first valvula moves. The left and right first valvulae slide back and forth alternately during the alternate contraction of the left and right T9-second valvifer muscle pairs (1vf left, 1vv right: Fig. 3B; Vilhelmsen 2000). This alternate movement is what is underlying the advance of the egg inside the egg canal and the drilling of the terebra into a substrate. The former function is facilitated by the presence of internal, posteriorly oriented cuticular modifications (Austin and Browning 1981) while the latter could be aided by anchoring structures on the first valvulae (Vilhelmsen 2000).

Adaptations effecting the alternate movements and configuration of the first valvulae might be mostly affected by the hardness of the substrate and constraints for fast oviposition. Oviposition into a concealed, and therefore relatively immobile host requires a robust system that has to be strong enough to drill or break the barrier. On the other hand, parasitization of an exposed, mobile but relatively soft host requires fast and perhaps less robust mechanism. Two major egg laying habits have been recorded within Ceraphronoidea: oviposition inside a mobile host and oviposition trough a hard but relatively thin barrier enclosing the host, which has restricted movement (Dessart 1995b, c). *Ceraphron* and numerous *Aphanogmus* species were reported to parasitize free living Diptera larvae (Laborius 1972) whereas most *Dendrocerus* species and some *Aphanogmus* parasitize hosts hidden by the hardened integument of the primary host (Fergusson 1980), the wall of the cocoon (Peter and David 1990, Alam 1985) or galls (Bakke 1955) developed around the host.

The relative distance between the anterior angle of the first valvifer and the intervalvifer articulation (ang, iva: Figs 1B, 2C, E, 3C, E, 4A, E, F, 5A, 6A, C, D) is most probably positively correlated with the degree of the sliding motion of the first valvula (Prentice 1998). The posterior margin of the first valvifer angled at the tergo-valvifer articulation (**tva**: Fig.) in most Hymenoptera (Oeser 1961, Vilhelmsen 2000). It is easy to see that the distance between the anterior angle of the first valvifer and the intervalvifer articulation and thus the degree of motion of the first valvula is larger with less acute angle at the tergo-valvifer articulation. A straight posterior margin of the first valvifer has been reported in a few Chalcidoidea (*Epidinocarsis*, Le Ralec et al. 1996; *Spalangia*, fig. 6 in Copland and King 1972) and in Apoidea (*Pryonx*, Prentice 1989). The only ceraphronoid taxon with a angled margin is *Dendrocerus*, while the rest have straight or concave (*Trassedia*) posterior margins. The location of the tergo-valvifer articulation on the posterior margin of the first valvifer seems to be also influenced by the way the first valvifer is moved. The closer the tergo-valvifer articulation is to the intervalvifer articulation and the further from the anterior angle, the further the first valvula will slide on the second valvula. The tergo-valvifer articulation is adjacent to the anterior angle of the first valvifer in *Aphanogmus* sp1. This indicates a first valvula sliding motion of very short distance but, considering the extended site of origin of the T9-second valvifer muscles, with relatively great power. The presence of an anterior angle corresponding to the tergo-valviferal articulation is unique in Hymenoptera.

Two ridges/apodemes are present on T9 in most Hymenoptera, the anterior flange of T9 and the cordate apodeme. The anterior flange extends along the anterior margin of the tergite and might be homologous with the antecosta of the ninth abdominal tergum of other insects because it receives the site of attachment of the dorsal T8-T9 muscle in *Macroxyela* (Vilhelmsen 2000). The dorsal T9-second valvifer muscle arises at least partly from the flange in the rest of Hymenoptera. The cordate apodeme is close to the tergo-valvifer articulation and receive the site of attachment of the ventral T9-second valvifer muscle. It is apophysis-like and extends internally in most basal hymenopterans but ridge-like and extended posteriorly in Siricoidea, Orussidae, and numerous Apocrita (“diagonal ridge” sensu Fergusson 1988). The apodeme is usually well separated from the anterior flange of T9 in Apocrita, except in *Bruchophagus*, where they are seemingly fused anteriorly (Copland and King 1971). Only one ridge, the anterior ridge of T9 extends along the anterior margin of T9 and receives the site of attachment of both the ventral and the dorsal T9-second valvifer muscles in Ceraphronoidea. This condition is unique in Hymenoptera. As described above, the dorsal and ventral T9-second valvifer muscles move the first valvifer indirectly. Host relationships of *Megaspilus* remain unknown, but it is possible that some bands of the ventral muscle insert on the interarticular ridge of the first valvula and thus the contraction of it might cause the direct movement of the sclerite.

The first valvifer is composed of two articulating sclerites in *Trassedia*. Although this condition is possibly plesiomorphic for Insecta (Klass et al. 2013) it is present only in a few taxa i.e. Archaeognatha, most ovipositor bearing Odonata and some Dermaptera (Klass *personal communication*). When the ventral T9-second valvifer muscle contracts the two sclerites of the first valvifer pivot anteriorly together as one unit. The two sclerites articulate with one another anteriorly, however, allowing the dorsal sclerite to pivot posteriorly on the ventral sclerite at the intravalvifer articulation when the dorsal T9-second valvifer muscle is contracted (Figs 3A–E). The first valvulae are thus enabled to slide a very long distance along the second valvulae in this unique system, probably allowing the egg to move quickly down the length of the ovipositor.

The presence or absence of annuli at the tip of the ovipositor may depend on the hardness of the substrate into which the wasp is ovipositing, as well as the circumstances under which oviposition is taking place (Quicke et al. 1999, Le Ralec et al. 1996, Gerling et al. 1998). Megapilidae, similar to numerous other non-ichneumonoid apocritans do have annuli apically only on the second valvulae whereas Ceraphronidae lack them from both valvulae. In general it seems that the harder the substrate is, the more developed the ovipositor sculpture is (Le Ralec et al. 1996).

A minute gland (dgl?: Figs 3B, 5A) and a relatively larger gland reservoir (res: Figs 3A–E, 5A, B, E, F, 4C), enclosed by the second valvifers, have been detected in Ceraphronidae including *Trassedia* and *Lagynodes*. The Dufour’s gland and the venom gland reservoir has a similar location in some Chalcidoidea (Copland and King 1971) where it was hypothesized that the ventral second T9-second valvifer muscles might aid to discharge the reservoir (res: Fig. 5B). The gland extract of this possible venom reservoir is resin-like (hard, transparent and amber colored) in critical point dried *Cer-*

*aphron* specimens (res: Fig. 5F) implying its possible cement nature that might be used for coating the eggs or fastening them on a surface. *Ceraphron* and some *Aphanogmus* species are reported to be endoparasitoids (Cordero and Cave 1992) in which lifestyle the egg coating can be crucial for avoiding the host immune response. We did not observe any glands or resin containing reservoirs in Megaspilinae. Höller et al. (1993) identified the Dufour's gland in *Dendrocerus carpenteri* outside of the second valvifers and reported the absence of the venom gland in this taxon. Nevertheless, more accurate, TEM based examination of the accessory gland system of Ceraphronoidea is needed for clarifying the function of the gland and gland reservoir located inside the second valvifer.

In general, the ovipositors of *Ceraphron*, *Trassedia* and *Aphanogmus* sp. 2 are less robust and capable of a very large degree of motion, corresponding to the available data about ovipositing in exposed and active hosts. *Trassedia* represents, perhaps, a more extreme version of the “quickly into soft substrate” oviposition type. Megaspilidae, on the other hand, have a stronger, more robust ovipositor systems, which afford the smaller degree of motion required for handling a harder substrate concealing a static host. *Dendrocerus*, for example, exhibits extended sites of origins for muscles and a very small degree of motion for the first valvulae. *Aphanogmus* sp. 1, although it belongs to Ceraphronidae, shares numerous characteristics with *Dendrocerus* and therefore may represent the *Aphanogmus*-group that parasitizes hosts obscured by harder barrier, e.g., the wall of a plant gall, and thus is a case of parallelism driven by the same environmental constraints.

So far it is widely accepted that Ceraphronoidea is composed of two extant families, Ceraphronidae and Megaspilidae, plus two fossil families not treated here. The limits between the two families, however, have been challenged recently (Mikó and Deans 2009, Mikó et al. in press). Although the presence of the annuli in Megaspilidae and absence from Ceraphronidae supports the traditional classification, the location of a resin producing gland inside the second valvifers is shared by the megaspilid subfamily Lagynodinae and Ceraphronidae.

## Acknowledgments

We thank the following curators who loaned material to conduct this study: Lubomír Masner from the Canadian National Collection, Brian Fisher from California Academy of Sciences, Bob Zuparko from California Academy of Sciences and the Berkeley Essig Museum, Michael Sharkey from the University of Kentucky, and Dave Karlsson of Uppsala University. We are grateful to Matt Yoder, Lars Vilhelmsen, Katja Seltmann, Matt Bertone, Patricia Mullins, Heather Campbell, Bob Blinn, Lubomír Masner and Jim Balhoff for valuable input and assistance with this manuscript. We especially thank Eva Johannes (Cellular and Molecular Imaging Facility, NCSU) and Missy Hazen (Penn State Microscopy and Cytometry Facility - University Park, PA) for her help with CLSM, Chuck Mooney (Analytical Instrumentation Facility, NCSU)

for his assistance with SEM and Rolf Beutel. This research was funded in part by the U.S. National Science Foundation (grants DBI-0850223, DEB-0842289) and benefited from discussions initiated through the Phenotype Research Coordination Network (NSF DEB-0956049).

## Appendix

Anatomical terms used, cross-referenced to an ontological (formal) definition (Hymenoptera Anatomy Ontology; URI = Uniform Resource Identifier).

Abbreviation	Label	Concept	URI
	absent	A quality denoting the lack of an entity.	<a href="http://purl.obolibrary.org/obo/PATO_0000462">http://purl.obolibrary.org/obo/PATO_0000462</a>
	adjacent to	A spatial quality inhering in a bearer by virtue of the bearer's being located near in space in relation to another entity.	<a href="http://purl.obolibrary.org/obo/PATO_0002259">http://purl.obolibrary.org/obo/PATO_0002259</a>
<b>ann</b>	annulus, annuli	The carina that is transverse and extends across the lateral wall of the terebra.	<a href="http://purl.obolibrary.org/obo/HAO_0001173">http://purl.obolibrary.org/obo/HAO_0001173</a>
<b>ang</b>	anterior angle of the first valvifer	The corner on the first valvifer that marks the posterior end of the first valvula.	<a href="http://purl.obolibrary.org/obo/HAO_0002168">http://purl.obolibrary.org/obo/HAO_0002168</a>
<b>aa</b>	anterior area of the second valvifer	The area of the second valvifer which is anterior to the anatomical line that is the shortest distance from the first valviferal fossa of the second valvifer and the ventral margin of the second valvifer	<a href="http://purl.obolibrary.org/obo/HAO_0002169">http://purl.obolibrary.org/obo/HAO_0002169</a>
	anterior flange of T9	The flange that extends along the anterolateral margin of female T9.	<a href="http://purl.obolibrary.org/obo/HAO_0001171">http://purl.obolibrary.org/obo/HAO_0001171</a>
<b>afl</b>	anterior flange of the first valvifer	The flange that extends anteriorly on the first valvifer and overlaps with the posterior margin of the anterior area of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002166">http://purl.obolibrary.org/obo/HAO_0002166</a>
	anterior margin	anatomical margin and (overlaps some anterior side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000671">http://purl.obolibrary.org/obo/BSPO_0000671</a>
<b>an2</b>	anterior notch of the dorsal valve	The notch that is located anteriorly on the dorsal ramus of the second valvula that accommodates the ventral ramus of the second valvula and the first valvula.	<a href="http://purl.obolibrary.org/obo/HAO_0002178">http://purl.obolibrary.org/obo/HAO_0002178</a>
	anterior region, anteriorly	anatomical region and (overlaps some anterior side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000071">http://purl.obolibrary.org/obo/BSPO_0000071</a>
<b>ar9</b>	anterior ridge of T9	The ridge that extends along the anterior margin of female T9 and receives the site of origin of the ventral and the dorsal T9-second valvifer muscles.	<a href="http://purl.obolibrary.org/obo/HAO_0002182">http://purl.obolibrary.org/obo/HAO_0002182</a>
	anterior second valvifer-second valvula muscle	The ovipositor muscle that arises from the anterodorsal part of the second valvifer and inserts subapically on the processus articulares.	<a href="http://purl.obolibrary.org/obo/HAO_0001166">http://purl.obolibrary.org/obo/HAO_0001166</a>
<b>asf</b>	anterior section of dorsal flange of the second valvifer	The area of the dorsal flange of the second valvifer that is anterior to the site of origin of the basal line.	<a href="http://purl.obolibrary.org/obo/HAO_0002173">http://purl.obolibrary.org/obo/HAO_0002173</a>
	anterior to	A spatial quality inhering in a bearer by virtue of the bearer's being located toward the front of an organism relative to another entity.	<a href="http://purl.obolibrary.org/obo/PATO_0001632">http://purl.obolibrary.org/obo/PATO_0001632</a>

<b>Abbreviation</b>	<b>Label</b>	<b>Concept</b>	<b>URI</b>
	anterodorsal margin	anatomical margin and (overlaps some anterior side) and (overlaps some dorsal side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000686">http://purl.obolibrary.org/obo/BSPO_0000686</a>
	anterolateral region	Anatomical region and (overlaps some anterior side) and (overlaps some lateral side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000029">http://purl.obolibrary.org/obo/BSPO_0000029</a>
	apodeme	The process that is internal.	<a href="http://purl.obolibrary.org/obo/HAO_0000142">http://purl.obolibrary.org/obo/HAO_0000142</a>
	attachement site	The area of the integument where muscles are attached to epidermal cells.	<a href="http://purl.obolibrary.org/obo/HAO_0002184">http://purl.obolibrary.org/obo/HAO_0002184</a>
	banding pattern	The anatomical cluster that is composed of the strongly sclerotised areas corresponding with the annuli and less strongly sclerotised areas situated between them.	<a href="http://purl.obolibrary.org/obo/HAO_0001176">http://purl.obolibrary.org/obo/HAO_0001176</a>
	basal articulation	The articulation that is part of the second valvifer-second valvula-third valvula complex and adjacent to the rhachis.	<a href="http://purl.obolibrary.org/obo/HAO_0001177">http://purl.obolibrary.org/obo/HAO_0001177</a>
<b>bl</b>	basal line of the second valvifer	The line on the second valvifer that extends between the pars articularis and the dorsal flange of second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002171">http://purl.obolibrary.org/obo/HAO_0002171</a>
	bent	A shape quality inhering in a bearer by virtue of the bearer's having one or more angle(s) in its length.	<a href="http://purl.obolibrary.org/obo/PATO_0000617">http://purl.obolibrary.org/obo/PATO_0000617</a>
	blunt	A shape quality inhering in a bearer by virtue of the bearer's terminating gradually in a rounded end.	<a href="http://purl.obolibrary.org/obo/PATO_0001950">http://purl.obolibrary.org/obo/PATO_0001950</a>
<b>bulb</b>	bulb	The anterior area of the dorsal valve that is bulbous.	<a href="http://purl.obolibrary.org/obo/HAO_0002177">http://purl.obolibrary.org/obo/HAO_0002177</a>
	concave	A shape quality in a bearer by virtue of the bearer's curving inward.	<a href="http://purl.obolibrary.org/obo/PATO_0001857">http://purl.obolibrary.org/obo/PATO_0001857</a>
	conjunctiva	The area of the integument that is weakly sclerotized, with thin exocuticle.	<a href="http://purl.obolibrary.org/obo/HAO_0000221">http://purl.obolibrary.org/obo/HAO_0000221</a>
	convex	A shape quality that obtains by virtue of the bearer having inward facing edges; having a surface or boundary that curves or bulges outward, as the exterior of a sphere.	<a href="http://purl.obolibrary.org/obo/PATO_0001355">http://purl.obolibrary.org/obo/PATO_0001355</a>
	cordate apodeme	The apodeme on the anterior margin of the abdominal tergum 9 that receives the ventral T9-second valvifer muscle.	<a href="http://purl.obolibrary.org/obo/HAO_0001585">http://purl.obolibrary.org/obo/HAO_0001585</a>
	corner	The projection that is located at the intersection of two or more edges.	<a href="http://purl.obolibrary.org/obo/HAO_0000223">http://purl.obolibrary.org/obo/HAO_0000223</a>
	count	The number of entities of this type that are part of the whole organism.	<a href="http://purl.obolibrary.org/obo/PATO_0000070">http://purl.obolibrary.org/obo/PATO_0000070</a>
	count value		<a href="http://purl.obolibrary.org/obo/PATO_0000416">http://purl.obolibrary.org/obo/PATO_0000416</a>
	curvature	A surface shape quality inhering in a bearer by virtue of the bearer's exhibiting a degree of bending.	<a href="http://purl.obolibrary.org/obo/PATO_0001591">http://purl.obolibrary.org/obo/PATO_0001591</a>

<b>Abbreviation</b>	<b>Label</b>	<b>Concept</b>	<b>URI</b>
	curved dorsally	A curvature quality inhering in a bearer by virtue of the bearer's being curved towards the back or upper surface of an organism.	<a href="http://purl.obolibrary.org/obo/PATO_0001468">http://purl.obolibrary.org/obo/PATO_0001468</a>
	curved medially	A curvature quality inhering in a bearer by virtue of the bearer's being curved towards the middle.	<a href="http://purl.obolibrary.org/obo/PATO_0002164">http://purl.obolibrary.org/obo/PATO_0002164</a>
	distal notch of the dorsal valve	The notch that is distal on the dorsal valve.	<a href="http://purl.obolibrary.org/obo/HAO_0002179">http://purl.obolibrary.org/obo/HAO_0002179</a>
	distal region	Anatomical region and (overlaps some distal side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000078">http://purl.obolibrary.org/obo/BSPO_0000078</a>
<b>dvc</b>	distal vertical conjunctiva of the second valvifer-third valvifer complex	The conjunctiva that traverses the second valvifer-third valvula complex and is located distal to the median bridge of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002180">http://purl.obolibrary.org/obo/HAO_0002180</a>
	distance	A quality that is the extent of space between two entities.	<a href="http://purl.obolibrary.org/obo/PATO_0000040">http://purl.obolibrary.org/obo/PATO_0000040</a>
	dorsal margin	Anatomical margin and (overlaps some dorsal side).	<a href="http://purl.obolibrary.org/obo/BSPO_0000679">http://purl.obolibrary.org/obo/BSPO_0000679</a>
<b>dp</b>	dorsal projection of the second valvifer	The projection that is located on the second valvifer and corresponds to the proximal end of the rachis.	<a href="http://purl.obolibrary.org/obo/HAO_0002172">http://purl.obolibrary.org/obo/HAO_0002172</a>
	dorsal region	anatomical region and (overlaps some dorsal side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000079">http://purl.obolibrary.org/obo/BSPO_0000079</a>
<b>d1vf</b>	dorsal sclerite of the first valvifer	The sclerite of the first valvifer that is located dorsally of the transvalviferal conjunctiva.	<a href="http://purl.obolibrary.org/obo/HAO_0002163">http://purl.obolibrary.org/obo/HAO_0002163</a>
<b>M2</b>	dorsal T8-T9 muscle	The abdominal muscle that arises from the anteromedian margin of female T8 and inserts on the anteromedian margin of the female T9.	<a href="http://purl.obolibrary.org/obo/HAO_0001571">http://purl.obolibrary.org/obo/HAO_0001571</a>
<b>M5</b>	dorsal T9-second valvifer muscle	The ovipositor muscle that arises along the posterodorsal part of the anterior margin of female T9 and inserts on the anterior section of the dorsal flanges of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0001569">http://purl.obolibrary.org/obo/HAO_0001569</a>
	dorsal to	x dorsal_to y if x is further along the dorso-ventral axis than y, towards the back. A dorso-ventral axis is an axis that bisects an organism from back (e.g. spinal column) to front (e.g. belly).	<a href="http://purl.obolibrary.org/obo/BSPO_0000098">http://purl.obolibrary.org/obo/BSPO_0000098</a>
	dorsal valve	The area that is articulated with the right and left second valvifers at the basal articulation and bears the rhachies.	<a href="http://purl.obolibrary.org/obo/HAO_0001658">http://purl.obolibrary.org/obo/HAO_0001658</a>
	dorsal view		<a href="http://purl.obolibrary.org/obo/BSPO_0000063">http://purl.obolibrary.org/obo/BSPO_0000063</a>
	dorsomedial region	anatomical region and (overlaps some dorsal side) and (overlaps some medial side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000069">http://purl.obolibrary.org/obo/BSPO_0000069</a>

Abbreviation	Label	Concept	URI
<b>ec</b>	egg canal	The anatomical space that is between the left and right rhachises.	<a href="http://purl.obolibrary.org/obo/HAO_0002191">http://purl.obolibrary.org/obo/HAO_0002191</a>
	elongated	A quality inhering in a bearer by virtue of the bearer's length being notably higher than its width.	<a href="http://purl.obolibrary.org/obo/PATO_0001154">http://purl.obolibrary.org/obo/PATO_0001154</a>
	fan-shaped	A quality inhering in a bearer that is shaped in the form of a fan.	<a href="http://purl.obolibrary.org/obo/PATO_0002219">http://purl.obolibrary.org/obo/PATO_0002219</a>
<b>1vf</b>	first valvifer	The area of the first valvifer-first valvula complex that is proximal to the aulax, bears the ninth tergal condyle of the first valvifer and the second valviferal condyle of the first valvifer and is connected to the genital membrane by muscle.	<a href="http://purl.obolibrary.org/obo/HAO_0000338">http://purl.obolibrary.org/obo/HAO_0000338</a>
<b>M8</b>	first valvifer-genital membrane muscle	The ovipositor muscle that arises from the posterior part of the first valvifer and inserts anteriorly on the genital membrane anetrior to the T9-genital membrane muscle.	<a href="http://purl.obolibrary.org/obo/HAO_0001746">http://purl.obolibrary.org/obo/HAO_0001746</a>
	first valvifer-second valvifer muscle	The ovipositor muscle that arises from the first valvifer and inserts on the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002189">http://purl.obolibrary.org/obo/HAO_0002189</a>
<b>1vv</b>	first valvula, first valvulae	The area of the first valvifer-first valvula complex that is delimited distally by the proximal margin of the aulax.	<a href="http://purl.obolibrary.org/obo/HAO_0000339">http://purl.obolibrary.org/obo/HAO_0000339</a>
<b>gm</b>	genital membrane	The conjunctiva that connects the ventral margins of the second valvifers.	<a href="http://purl.obolibrary.org/obo/HAO_0001757">http://purl.obolibrary.org/obo/HAO_0001757</a>
	height	A 1-D extent quality inhering in a bearer by virtue of the bearer's vertical dimension of extension.	<a href="http://purl.obolibrary.org/obo/PATO_0000119">http://purl.obolibrary.org/obo/PATO_0000119</a>
	increasing	quality and (increased_in_magnitude_relative_to some normal)	<a href="http://purl.obolibrary.org/obo/PATO_0002300">http://purl.obolibrary.org/obo/PATO_0002300</a>
<b>iar</b>	interarticular ridge of the first valvifer	The ridge that extends along the posterior margin of the first valvifer between the inter-valvifer and tergovalvifer articulations.	<a href="http://purl.obolibrary.org/obo/HAO_0001562">http://purl.obolibrary.org/obo/HAO_0001562</a>
<b>iva</b>	intervalvifer articulation	The articulation between the first valvifer and second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0001558">http://purl.obolibrary.org/obo/HAO_0001558</a>
<b>iava</b>	intravalvifer articulation	The articulation between the dorsal sclerite of the first valvifer and the ventral sclerite of the first valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002165">http://purl.obolibrary.org/obo/HAO_0002165</a>
	lateral region	anatomical region and (overlaps some lateral side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000082">http://purl.obolibrary.org/obo/BSPO_0000082</a>
<b>M3</b>	lateral T8-T9 muscle	The ninth abdominal tergal muscle that arises from the anterolateral margin of female T8 and inserts on the anterolateral margin of female T9.	<a href="http://purl.obolibrary.org/obo/HAO_0001776">http://purl.obolibrary.org/obo/HAO_0001776</a>
	lateral T9-second valvifer muscle	The muscle that arises from the posteroven-tral parts of the female T9 and inserts on the median bridge.	<a href="http://purl.obolibrary.org/obo/HAO_0002187">http://purl.obolibrary.org/obo/HAO_0002187</a>

<b>Abbreviation</b>	<b>Label</b>	<b>Concept</b>	<b>URI</b>
	lateral view		<a href="http://purl.obolibrary.org/obo/BSPO_0000066">http://purl.obolibrary.org/obo/BSPO_0000066</a>
	length of anterior area of second valvifer	The anatomical line that is parallel with the longitudinal body axis and the shortest among the anatomical lines that extends between the anterior and posterior margins of the anterior area of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002240">http://purl.obolibrary.org/obo/HAO_0002240</a>
	length of dorsal projection	The anatomical line that is parallel with the longitudinal body axis and the shortest among the anatomical lines that extends between the anterior and posterior margins of the dorsal projection.	<a href="http://purl.obolibrary.org/obo/HAO_0002193">http://purl.obolibrary.org/obo/HAO_0002193</a>
	length of female T9	The anatomical line that is parallel with the longitudinal body axis and the shortest among the anatomical lines that extend between the anterior and posterior margins of female T9.	<a href="http://purl.obolibrary.org/obo/HAO_0002241">http://purl.obolibrary.org/obo/HAO_0002241</a>
	medial side	a point in the centre of the organism (where the left-right axis intersects the midsagittal plane)	<a href="http://purl.obolibrary.org/obo/BSPO_0000067">http://purl.obolibrary.org/obo/BSPO_0000067</a>
	median bridge	The area that connects posterodorsally the second valvifers and is the site of attachment for the posterior T9-second valvifer muscle.	<a href="http://purl.obolibrary.org/obo/HAO_0001780">http://purl.obolibrary.org/obo/HAO_0001780</a>
<b>mc2</b>	distal notch of the dorsal valve	The notch that is distal on the dorsal valve.	<a href="http://purl.obolibrary.org/obo/HAO_0002179">http://purl.obolibrary.org/obo/HAO_0002179</a>
<b>mc1</b>	medial conjunctiva of the first valvulae	The conjunctiva that extends medially along the first valvula.	<a href="http://purl.obolibrary.org/obo/HAO_0002192">http://purl.obolibrary.org/obo/HAO_0002192</a>
	median line	An axis that bisects an organism from head end to opposite end of body or tail.	<a href="http://purl.obolibrary.org/obo/BSPO_0000013">http://purl.obolibrary.org/obo/BSPO_0000013</a>
	medial region	anatomical region and (overlaps some medial side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000083">http://purl.obolibrary.org/obo/BSPO_0000083</a>
	ninth tergal condyle of the first valvifer	The condyle that is located on the first valvifer and articulates with the first valviferal fossa of T9.	<a href="http://purl.obolibrary.org/obo/HAO_0002160">http://purl.obolibrary.org/obo/HAO_0002160</a>
<b>oth</b>	olistheters	The anatomical cluster that is composed of the rhachis of the second valvula and the aulax of the first valvula.	<a href="http://purl.obolibrary.org/obo/HAO_0001103">http://purl.obolibrary.org/obo/HAO_0001103</a>
	overlaps	x overlaps y if they have some part in common.	<a href="http://purl.obolibrary.org/obo/bspo%23overlaps">http://purl.obolibrary.org/obo/bspo%23overlaps</a>
	ovipositor	The anatomical cluster that is composed of the first valvulae, second valvulae, third valvulae, first valvifers, second valvifers and female T9.	<a href="http://purl.obolibrary.org/obo/HAO_0000679">http://purl.obolibrary.org/obo/HAO_0000679</a>
<b>paa</b>	pars articularis	The articular surface that is situated anteriorly on the ventral margin of the second valvifer and forms the lateral part of the basal articulation.	<a href="http://purl.obolibrary.org/obo/HAO_0001606">http://purl.obolibrary.org/obo/HAO_0001606</a>

<b>Abbreviation</b>	<b>Label</b>	<b>Concept</b>	<b>URI</b>
	position	A spatial quality inhering in a bearer by virtue of the bearer's spatial location relative to other objects in the vicinity.	<a href="http://purl.obolibrary.org/obo/PATO_0000140">http://purl.obolibrary.org/obo/PATO_0000140</a>
	posteriorly	anatomical gradient and (has_axis some anterior/posterior axis)	<a href="http://purl.obolibrary.org/obo/BSPO_0000052">http://purl.obolibrary.org/obo/BSPO_0000052</a>
<b>pa</b>	posterior area of the second valvifer	The area of the second valvifer that is posterior to the anatomical line that is the shortest distance from the first valviferal fossa of the second valvifer to the ventral margin of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002170">http://purl.obolibrary.org/obo/HAO_0002170</a>
	posterior margin	anatomical margin and (overlaps some posterior side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000672">http://purl.obolibrary.org/obo/BSPO_0000672</a>
<b>p1v</b>	posterior margin of first valvifer	The margin of the first valvifer that is posterior and extends between the intervalvifer articulation and the anterior angle of the first valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002159">http://purl.obolibrary.org/obo/HAO_0002159</a>
<b>M9</b>	posterior second valvifer-second valvula muscle	The ovipositor muscle that arises posteroventrally from the second valvifer and inserts on the processus musculares of the second valvula.	<a href="http://purl.obolibrary.org/obo/HAO_0001815">http://purl.obolibrary.org/obo/HAO_0001815</a>
<b>psf</b>	posterior section of dorsal flange of the second valvifer	The area of the dorsal flange of the second valvifer that is posterior to the site of origin of the basal line.	<a href="http://purl.obolibrary.org/obo/HAO_0002174">http://purl.obolibrary.org/obo/HAO_0002174</a>
<b>M7</b>	posterior T9-second valvifer muscle	The ovipositor muscle that arises medially from the posterodorsal part of female T9 and inserts on the median bridge of the second valvifers.	<a href="http://purl.obolibrary.org/obo/HAO_0001813">http://purl.obolibrary.org/obo/HAO_0001813</a>
	posterior view		<a href="http://purl.obolibrary.org/obo/BSPO_0000056">http://purl.obolibrary.org/obo/BSPO_0000056</a>
	postero-medial region	anatomical region and (overlaps some posterior side) and (overlaps some medial side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000070">http://purl.obolibrary.org/obo/BSPO_0000070</a>
	posterdorsal to	A spatial quality inhering in a bearer by virtue of the bearer's being located toward the rear and upper surface of an organism relative to another entity.	<a href="http://purl.obolibrary.org/obo/PATO_0001916">http://purl.obolibrary.org/obo/PATO_0001916</a>
	posteroventral corner of first valvifer	The corner of the first valvifer that is adjacent to the intervalvifer articulation.	<a href="http://purl.obolibrary.org/obo/HAO_0002239">http://purl.obolibrary.org/obo/HAO_0002239</a>
	present	A quality inhering in a bearer by virtue of the bearer's existence.	<a href="http://purl.obolibrary.org/obo/PATO_0000467">http://purl.obolibrary.org/obo/PATO_0000467</a>
<b>pra</b>	processus articularis	The process that extends laterally from the proximal region of the second valvula and forms the median part of the basal articulation, and corresponds to the site of attachment for the anterior second valvifer-second valvula muscle.	<a href="http://purl.obolibrary.org/obo/HAO_0001704">http://purl.obolibrary.org/obo/HAO_0001704</a>

Abbreviation	Label	Concept	URI
prm	processus musculares	The apodeme that extends dorsally from the proximal part of the second valvula to the genital membrane and receives the site of attachment of the posterior second valvifer-second valvula muscle.	<a href="http://purl.obolibrary.org/obo/HAO_0001703">http://purl.obolibrary.org/obo/HAO_0001703</a>
	proportion	A quality inhering in a bearer by virtue of the bearer's magnitude in respect to a related entity.	<a href="http://purl.obolibrary.org/obo/PATO_0001470">http://purl.obolibrary.org/obo/PATO_0001470</a>
	quadrangular	A shape quality inhering in a bearer by virtue of the bearer's having four angles and four sides.	<a href="http://purl.obolibrary.org/obo/PATO_0001988">http://purl.obolibrary.org/obo/PATO_0001988</a>
	region	A 3D region in space without well-defined compartmental boundaries; for example, the dorsal region of an ectoderm.	<a href="http://purl.obolibrary.org/obo/BSPO_0000070">http://purl.obolibrary.org/obo/BSPO_0000070</a>
	resinous	A physical quality inhering in a bearer by virtue of the bearer exhibiting molecular attraction to another entity in contact.	<a href="http://purl.obolibrary.org/obo/PATO_0002331">http://purl.obolibrary.org/obo/PATO_0002331</a>
	ridge	The apodeme that is elongate.	<a href="http://purl.obolibrary.org/obo/HAO_0000899">http://purl.obolibrary.org/obo/HAO_0000899</a>
	S7	The sternite that is connected to the first valvula via muscles.	<a href="http://purl.obolibrary.org/obo/HAO_0002185">http://purl.obolibrary.org/obo/HAO_0002185</a>
	S7-first valvula muscle	The muscle that originates from the abdominal sternum 7 and inserts on the first valvula.	<a href="http://purl.obolibrary.org/obo/HAO_0001668">http://purl.obolibrary.org/obo/HAO_0001668</a>
	sclerite, sclerites	The area of the integument where the cuticle is well sclerotised with thick exocuticle.	<a href="http://purl.obolibrary.org/obo/HAO_0000909">http://purl.obolibrary.org/obo/HAO_0000909</a>
	second valvifer-genital membrane muscle	The ovipositor muscle that arises anteriorly from the dorsal flange of the second valvifer and inserts anteriorly on the dorsal part of the genital membrane.	<a href="http://purl.obolibrary.org/obo/HAO_0001672">http://purl.obolibrary.org/obo/HAO_0001672</a>
2vf	second valvifer	The area of the second valvifer-second valvula-third valvula complex that is proximal to the basal articulation and to the processus musculares and articulates with female T9.	<a href="http://purl.obolibrary.org/obo/HAO_0000927">http://purl.obolibrary.org/obo/HAO_0000927</a>
	second valvifer-genital membrane muscle	The ovipositor muscle that arises anteriorly from the dorsal flange of the second valvifer and inserts anteriorly on the dorsal part of the genital membrane.	<a href="http://purl.obolibrary.org/obo/HAO_0001672">http://purl.obolibrary.org/obo/HAO_0001672</a>
	second valviferal condyle of the first valvifer	The condyle that is located on the first valvifer and articulates with the first valviferal fossa of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002167">http://purl.obolibrary.org/obo/HAO_0002167</a>
	second valvifer-third valvula complex	The area of the second valvifer-second valvula-third valvula complex that is proximal to the basal articulation.	<a href="http://purl.obolibrary.org/obo/HAO_0002181">http://purl.obolibrary.org/obo/HAO_0002181</a>
2vv	second valvula, second valvulae	The area of the second valvifer-second valvula-third valvifer complex that is distal to the basal articulation and to the processus musculares and is limited medially by the median body axis.	<a href="http://purl.obolibrary.org/obo/HAO_0000928">http://purl.obolibrary.org/obo/HAO_0000928</a>

Abbreviation	Label	Concept	URI
spa	sensillar patch	The patch that is composed of placoid sensilla adjacent to the intervalvifer articulation.	<a href="http://purl.obolibrary.org/obo/HAO_0001671">http://purl.obolibrary.org/obo/HAO_0001671</a>
	shape	A morphological quality inhering in a bearer by virtue of the bearer's ratios of distances between its features (points, edges, surfaces and also holes etc).	<a href="http://purl.obolibrary.org/obo/PATO_0000052">http://purl.obolibrary.org/obo/PATO_0000052</a>
	sharpness	A shape quality inhering in a bearer by virtue of the bearer's having a sharp or tapered end or point.	<a href="http://purl.obolibrary.org/obo/PATO_0000944">http://purl.obolibrary.org/obo/PATO_0000944</a>
	sharp	A shape quality inhering in a bearer by virtue of the bearer's terminating in a point or edge.	<a href="http://purl.obolibrary.org/obo/PATO_0001419">http://purl.obolibrary.org/obo/PATO_0001419</a>
	spatulate	A shape quality inhering in a bearer by virtue of the bearer's being oblong, with the lower end very much attenuated.	<a href="http://purl.obolibrary.org/obo/PATO_0001937">http://purl.obolibrary.org/obo/PATO_0001937</a>
	straight	A shape quality inhering in a bearer by virtue of the bearer's being free of curves, bends, or angles.	<a href="http://purl.obolibrary.org/obo/PATO_0002180">http://purl.obolibrary.org/obo/PATO_0002180</a>
	surrounds		<a href="http://purl.obolibrary.org/obo/BSPO_0000101">http://purl.obolibrary.org/obo/BSPO_0000101</a>
	T8	The tergite that is connected to female T9 by muscles.	<a href="http://purl.obolibrary.org/obo/HAO_0002188">http://purl.obolibrary.org/obo/HAO_0002188</a>
	T8-first valvifer muscle	The ovipositor muscle that originates from the lateral part of female T8 and inserts on the dorsal margin of the first valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0001640">http://purl.obolibrary.org/obo/HAO_0001640</a>
	T9	The tergite that is articulated with the first valvifer and second valvifer and is connected to the second valvifer via muscles.	<a href="http://purl.obolibrary.org/obo/HAO_0000075">http://purl.obolibrary.org/obo/HAO_0000075</a>
	T9-genital membrane muscle	The ovipositor muscle that arises from the cordate apodeme and inserts dorsally on the proximal part of the genital membrane and on the opposite cordate apodeme.	<a href="http://purl.obolibrary.org/obo/HAO_0001639">http://purl.obolibrary.org/obo/HAO_0001639</a>
	tapered	A shape quality inhering in a bearer by virtue of the bearer's being gradually narrower or thinner toward one end.	<a href="http://purl.obolibrary.org/obo/PATO_0001500">http://purl.obolibrary.org/obo/PATO_0001500</a>
trb	terebra	The anatomical cluster that is composed of the first and second valvulae.	<a href="http://purl.obolibrary.org/obo/HAO_0001004">http://purl.obolibrary.org/obo/HAO_0001004</a>
tva	tergo-valvifer articulation	The articulation that is located between the abdominal tergum 9 and the first valvifer and is composed of the ninth tergal condyle of the first valvifer and the first valviferal fossa of the ninth tergite.	<a href="http://purl.obolibrary.org/obo/HAO_0001636">http://purl.obolibrary.org/obo/HAO_0001636</a>
	thickened	A thickness which is relatively high.	<a href="http://purl.obolibrary.org/obo/PATO_0000591">http://purl.obolibrary.org/obo/PATO_0000591</a>
	thickness	A 1-D extent quality which is equal to the dimension through an object as opposed to its length or width.	<a href="http://purl.obolibrary.org/obo/PATO_0000915">http://purl.obolibrary.org/obo/PATO_0000915</a>

Abbreviation	Label	Concept	URI
<b>3vv</b>	third valvula, third valvulae	The area of the second valvifer-third valvula complex that is posterior to the distal vertical conjunctiva of the second valvifer-third valvula complex.	<a href="http://purl.obolibrary.org/obo/HAO_0001012">http://purl.obolibrary.org/obo/HAO_0001012</a>
<b>tvc</b>	transvalvifer conjunctiva	The conjunctiva that traverses the first valvifer and separates the dorsal and ventral sclerites of the first valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0002162">http://purl.obolibrary.org/obo/HAO_0002162</a>
	triangular	A shape quality inhering in a bearer by virtue of the bearer's having three angles.	<a href="http://purl.obolibrary.org/obo/PATO_0001875">http://purl.obolibrary.org/obo/PATO_0001875</a>
<b>res</b>	venom gland reservoir of the second valvifer	The gland reservoir that is between the second valvifers.	<a href="http://purl.obolibrary.org/obo/HAO_0002176">http://purl.obolibrary.org/obo/HAO_0002176</a>
	ventral margin	anatomical margin and (overlaps some ventral side)	<a href="http://purl.obolibrary.org/obo/BSPO_0000684">http://purl.obolibrary.org/obo/BSPO_0000684</a>
<b>vr2</b>	ventral ramus of the second valvula	The area of the second valvifer-second valvula-third valvifer complex that bears the rhachis.	<a href="http://purl.obolibrary.org/obo/HAO_0001107">http://purl.obolibrary.org/obo/HAO_0001107</a>
<b>v1v</b>	ventral sclerite of the first val- vifer	The sclerite of the first valvifer that is ventral to the transvalviferal conjunctiva.	<a href="http://purl.obolibrary.org/obo/HAO_0002164">http://purl.obolibrary.org/obo/HAO_0002164</a>
<b>M6</b>	ventral T9- second valvifer muscle	The ovipositor muscle that arises from the lateral region of female T9 and inserts along the posterior part of the dorsal flange of the second valvifer.	<a href="http://purl.obolibrary.org/obo/HAO_0001616">http://purl.obolibrary.org/obo/HAO_0001616</a>
	ventral to	x ventral_to y if x is further along the dorso-ventral axis than y, towards the front. A dorso-ventral axis is an axis that bisects an organism from back (e.g. spinal column) to front (e.g. belly).	<a href="http://purl.obolibrary.org/obo/BSPO_0000102">http://purl.obolibrary.org/obo/BSPO_0000102</a>
	width	A 1-D extent quality which is equal to the distance from one side of an object to another side which is opposite.	<a href="http://purl.obolibrary.org/obo/PATO_0000921">http://purl.obolibrary.org/obo/PATO_0000921</a>
